
Linux Info and Structure

Dark theme English version

Linux is a stable, secure, and flexible operating system for servers, computers, development, and embedded systems, with strong community support.

How Linux is used

- Install a distribution such as Ubuntu, Debian, or Fedora.
- Use a desktop environment or the terminal for commands.
- Manage files, packages (apt or dnf), and system configuration.

Why Linux is used

- Stable operation and high reliability
- Fast security updates
- Full freedom to customize the system
- Strong support for servers, cloud, and containers

Common directories in Linux

- / - root, the base of the entire filesystem
- /bin - essential commands
- /sbin - system administration tools
- /etc - configuration files
- /home - user home directories
- /root - the root user's home directory
- /var - logs and variable data
- /tmp - temporary files
- /usr - user programs and libraries
- /lib - shared libraries
- /opt - third-party software
- /dev - device files
- /proc - process and kernel information
- /sys - kernel and hardware information
- /media - removable media
- /mnt - temporary mount points
